

Accessly

Kraków without barriers

Your city. Your needs. Check before you go.

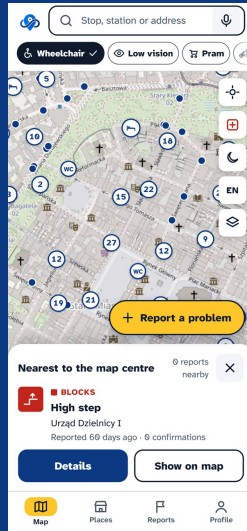

Verified accessibility of places as a service: free for residents and tourists, paid for venues, event organisers and cities. Every fact carries its source, date and verification status.

Team Accessly · Team ID: ...
HackYeah 2026 · “Cracow without barriers” challenge

Demo: <https://accessly.example.pl>

Code: <https://github.com/HakerSII/accessly>

Video (3 min): <https://youtu.be/...>

Who pays today for missing accessibility information

Three parties, one data gap

- **Guest** (wheelchair, pram, senior): does not know whether they can get in, so they do not book or make a wasted trip. An “accessible” label without a source or date says nothing.
- **Venue**: loses customers it never sees and answers the same questions about steps and toilets by e-mail and phone.
- **City**: has a statutory duty to ensure accessibility, but no current data and no capacity to maintain a database by hand.

Scope of the prototype

Wheelchair users and parents with prams. The same data serves 8 needs profiles, from seniors to medical tourists, and the interface works in Polish, English, German and Ukrainian.

The market we start with

Kraków, the Accessly catalogue built from OpenStreetMap

502

accommodation

2,622

food & drink

1,117

health

Demand*

- about 14 million visitors to Kraków a year
- 5.4 million people with disabilities in Poland; one resident in five is 65 or older
- growing medical tourism: patients from abroad ask about accessibility before booking

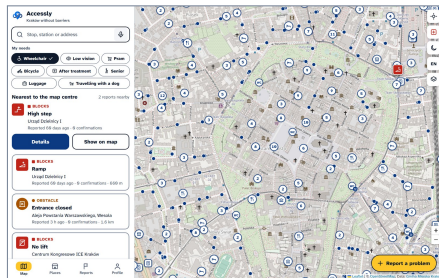

* External figures to verify before the pitch: visitor surveys of the Małopolska Tourist Organisation, Statistics Poland (2021 census, population).

Solution: verified accessibility as a service

- **Resident and tourist (free).** A needs profile instead of a question about disability; a place card with facts, source, date and status; a barrier map; a natural-language assistant that shows only facts from the database.
- **Venue owner (Pro plan).** A panel: confirms and completes data, answers guests' questions, sees what they look for and what is missing; the "Confirmed by the owner" badge.
- **City and partners.** Current data without maintaining a database, gap statistics for planning, an Open API for maps and booking, a white-label deployment in the next city.

Working today, not a mock-up

6,545 places and 27 attributes, 11 city and OSM data layers, a barrier map, owner and admin panels, 4 languages, 503 tests. A web app for phone and desktop, no installation.

"Wheelchair" profile: places, city and OSM layers, reported barriers with severity and confirmations. The list next to the map is its text alternative.

6,545

places

27

attributes

11

data layers

Demo: Anna, a wheelchair user, looks for a café in the centre

Step	What to look at
1	Needs profile "Wheelchair" the map and lists show only barriers that matter for a wheelchair; ranking by match
2	Question: "a café in the centre, wheelchair, with a toilet" a ranking with reasons: what the place meets and what is <i>unknown</i>
3	Place card every fact has a source, a date and a status; missing data is named as such, with an "Add" button
4	Report "No lift" at a stop, severity "Blocks" square marker = blocks; "Still there" / "Fixed" votes; the outage expires after 14 days
5	Owner panel: confirm the information status "Confirmed by the owner"; Anna gets a notification

Edge cases shown in the demo: conflicting data → "Needs re-checking"; city data unavailable → snapshot with an "as of" date; missing information never counts as accessible.

Sample data is marked: demo accounts (anna@, kasia@, admin@accessly.test), test reports, a "Demo mode" label.

Meets 0 of your 3 needs

Does not meet: Step-free entrance, Accessible toilet

No data: Wide doors (at least 90 cm). If you know, add it below or ask the owner.

Step 3: the match summary – what the place meets, what it does not, what is unknown.

 **Step-free entrance** · important to you No

From an official source

Source: OpenStreetMap

02/10/2026

częściowo dostępne (wheelchair=limited)

Up to date

Outdated

Correct

One fact: value, source (OpenStreetMap), date (2 Oct 2026), status and the Up to date / Outdated / Correct buttons.

Why they will trust us

	Existing maps [*]	Accessly
Source and date per fact	rarely	always, on every attribute
Verification status	one yes / no label	5 statuses computed from confirmations and time
Channel for the owner	none, or editing the entry	B2B panel: guests' questions, statistics, bulk facilities
Outages "right now"	none	barrier map with votes and automatic expiry
Needs profiles	wheelchair	8 profiles, incl. pram, senior, medical tourism
City open data	none	6 layers from otwartedane.um.krakow.pl, refreshed every 24 h

^{*} E.g. Wheelmap, accessibility attributes in Google Maps, national audit databases; as of October 2026, verify before the pitch.

Trust model: status, source and date on every fact

- **Four sources:** OpenStreetMap, Kraków open data, the owner, the community; the import never overwrites data entered by people.
- **Status computed on every read:** Confirmed by the owner > Confirmed by the community (≥ 2) > From an official source > Not verified; a dispute or 365 days without confirmation → Needs re-checking.
- **Missing information never means "accessible";** conflicts are flagged, not averaged; every change stays in the history; outages expire after 14 days.
- **When a source is silent:** cache → snapshot with an "as of" date; no screen is ever empty.

Business model and pricing (proposal)

Segment	Offer	Price
Residents and tourists	the app, needs profile, assistant, barrier map	PLN 0, always – they create the data
Venues (hotels, food & drink, culture)	Pro plan: owner badge, statistics on “what guests look for and what is missing”, bulk facilities, an accessibility widget for the website and the booking system	PLN 49 / month per venue; chains PLN 299 / month for up to 10 venues
Event organisers, property managers	event package: temporary entrances and routes, a barrier map for the event	PLN 990 per event; PLN 2,990 per season
Cities and regions	white-label: configuration, OSM import, city layers, gap reports	PLN 30–60k deployment + PLN 2–4k / month
Maps, travel apps, booking	Open API with attribution: facts with source, date and status	free up to 10k requests / month, annual licence above

Revenue scenario: Kraków, second year of operation

Scenario	Pro venues	Events	Cities	Revenue / year
Conservative	60 (2 %)	5	0	about PLN 40k
Base	155 (5 %)	10	1	about PLN 175k
Ambitious	310 (10 %)	20	2	about PLN 365k

Assumptions

Share of the 3,124 accommodation and food venues in the catalogue. Fixed costs without salaries below PLN 2k a month (hosting, e-mail, AI per request). Prices and adoption are verified in a 30-day pilot.

Principle: owners pay for tools and visibility, never for status – the status always follows verification.

Go-to-market: from hotels and clinics to a second city

First customers and channels

- **Hotels and medical tourism clinics** (502 accommodation and 1,117 health venues in the catalogue): guests from abroad ask about accessibility before booking; the “After treatment” profile.
- **Cultural institutions and event organisers** (420 culture venues, halls and arenas): a statutory accessibility duty and participants’ questions before every event.
- **Channels:** tourism organisations and hotel associations, the medical tourism cluster, the city as a reference; a community partner to verify data.

Tailwind: regulation

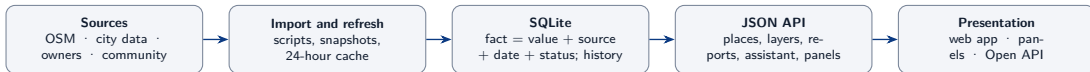

- **Polish Accessibility Act (2019):** public entities must ensure and report accessibility.
- **Digital Accessibility Act (2019)** and WCAG 2.2 for public websites and apps.
- **European Accessibility Act** (applies from June 2025): e-commerce, transport and online services must inform about accessibility.

Institutions need data, venues an argument, cities a tool without their own IT.

Scaling to other cities

A new city = a configuration file (name, bounds) + an OpenStreetMap extract (available for all of Europe) + the city’s open layers, if any. Catalogue, profiles, statuses and panels are shared; a local partner moderates.

Ready to deploy

Technology

Python (standard library), SQLite, Leaflet: zero dependencies. 47 MB Docker image; Ansible + Caddy (automatic HTTPS) on any VPS; 503 tests, no network. Optional services have fallbacks.

Security and privacy

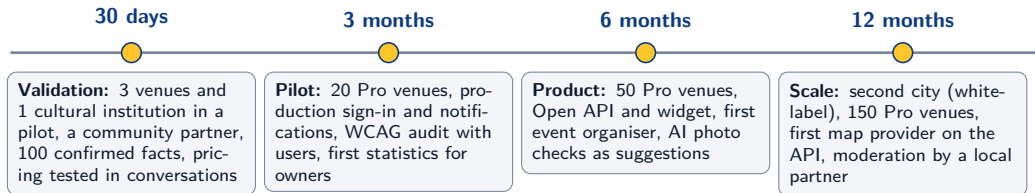

Anonymous without an account, no IP logging. The profile is preferences, never a diagnosis. Sign-in by e-mail code, SHA-256 hashes, HttpOnly / Secure cookie, size limits, privacy policy in the app, data in the EU.

Digital accessibility as an advantage

The main scenario checked against WCAG 2.2 A/AA: keyboard, screen reader, contrast, map as text. Still to do: an audit with users, keyboard access to map markers, panels. A precondition for selling to institutions.

Operations outside the City: an operator (company or foundation), infrastructure about PLN 60–120 (EUR 15–30) a month, one-command updates, city data refreshes itself, moderation in the admin panel.

Milestones and metrics

Metric (monthly report)	Today	Target: 12 mo.
Places with at least one fact	23 % (1,495 of 6,545)	60 %
Pro venues (paying owners)	0	150
Facts confirmed by people / month	–	500
Owner response time to a question	–	under 48 h

Conditions for a second city

Open city data (or OpenStreetMap alone), a local partner for moderation and 2–3 venues to start. The rest is configuration.

Team and what we need

Team

First Last product, UX, venue outreach
First Last backend, open data, deployment
First Last frontend, digital accessibility
First Last business model, partners

Prototype built during HackYeah; the code is in an open repository and runs with one command.

What we are looking for after the hackathon

- **3 venues and 1 cultural institution** in Kraków for a 30-day pilot of the owner panel.
- **A community partner** (disability organisation) to verify data and test accessibility with users.
- **Contacts to a second city's open data** and to tourism organisations as a channel.
- **Pre-deployment funding** for 6 months (accelerator, accessibility grant) until Pro-plan revenue covers the team.

Not a static map: a living, verifiable picture of accessibility that pays for itself.
